God bless them. They finally said: Well, we are going to stop that. Instead of having maybe a couple thousand people on "The Beast," this train—this freight train with people on top of the freight cars holding on for dear life—now we have a handful—maybe a handful—of people allowed to do this, which is helpful.

The other thing Mexico can be helpful in—and they are doing I think a better job—is sharing information with us, the sharing of information. They have an idea of who is coming through their country, who is bringing them, and we need that information. We actually need some more information from Honduras and Guatemala.

We are getting reasonably good information, intelligence from the Mexicans and the other countries, and we need it to be better. To the extent that we get that better information, it enables us to be better positioned to respond with human assets and with some of these force multipliers that I have been talking about.

I wish to mention—if I could again go back to the border crossings. When we think of a border crossing, we think of a road maybe or something, maybe it is a bridge. These are unbelievable. Some of them are huge and unbelievable infrastructures that have been constructed with multiple lanes of traffic going each way. Traffic is backed up in some cases for hours trying to get from the United States into Mexico. Maybe they are taking parts down for auto assembly and then coming back with finished products.

But there is a huge flow of trade which benefits Mexico and frankly benefits us as well. There is an old saying: Time is money. To the extent that folks in a just-in-time economy are trying to move products, trying to move goods, to have to wait for those lengths of time is not good.

We can do a better job. We need to do a better job in terms of the people whom we have working there at the border for us and in terms of the kind of technology we are using.

I wish to use as an example one piece of technology that I saw, something just a little bit bigger than my handheld device here. A woman who is working the border at the crossing for all the trucks trying to come and go—she showed me her handheld device. She said: These are the next six or so trucks lined up to come through from northern Mexico.

I said: Really? Do you know anything about any of them?

She clicked on one of the trucks. It had the history of the truck coming across our border this year—maybe even before this year—and the driver information, about who is the driver, how often has he or she been coming across our border. It is very good stuff.

We have the ability to detect radiation, the ability to detect shipments of guns, and the ability to detect people who are in vehicles. That is all well and good, but we need to continue to

update and modernize that technology at the border and frankly put more money into the infrastructure so that flow of commerce is not impeded to the extent it is today.

I think that is it, pretty much. I always think, when I go through a long ramble such as this, I should come back at the end and try to point out a couple of points and repeat what I really want to convey.

I am really glad we went to the border. I have learned a lot each time I have gone. I certainly learned a lot this weekend. One of the things that gives me special joy is that it helped me identify and reinforce items such as the tethered dirigible—the kind of technology we can hang on to and deploy across the border in all kinds of locations. How important that technology is.

The other item that came home to me was that we spend a huge amount of money on these measures—one-quarter of a trillion dollars in the last 10 years on securing our borders. We spent less than 1 percent of that trying to help-along with Mexico, Colombia, and the Inter-American Development Bank—the countries of El Salvador. Honduras, and Guatemala to become less places of desolation and fear. We want to help them. It is not for us to do this by ourselves. It is not our job. What do they say at Home Depot? You can do it; we can help. In this case it would be like Colombia. In Colombia, 20-some years ago, what happened was a bunch of gunmen rounded up their supreme court justices, took them into a room and shot them to death-11 justices of their supreme court. Colombia was oppressed on the one hand by leftist guerillas and on the other hand by narco drug lords. A lot of people said they were going down. But they made it, in part with our help and Plan Colombia.

The folks who—the presidents of Honduras, Guatemala, and El Salvador have come up, with our encouragement, with their own Plan Colombia to focus on, among other things, restoring the rule of law, going after corruption, making sure police police, prosecutors prosecute, judges administer justice, and correctional systems prisons actually correct behavior.

They are looking at the schools. Kids are finishing up after grade 6 and, frankly, without the skills they need to do much of anything. So they are looking to make sure those schools are producing students better equipped and prepared to be gainfully employed.

Also, as I said, half of the secondary roads in Honduras were wiped out after Hurricane Mitch. Half of them were wiped out, and there is a need for them, with maybe some help from a bunch of us—Mexico, Colombia, NGOs, and non-profits—to work on that.

The other thing is the energy piece. If they are going to have jobs down there, they need to have affordable energy, and it is not going to be from the continued use of electricity through

the use of petroleum but through lowpriced natural gas and by strengthening their grid—really, to build and rebuild their electric grid.

So those are some of my take-aways. I wanted to share some of those with my colleagues.

I hope we don't shut down the Department of Homeland Security. They do important work for us, and we need them to be on the job. Frankly, we don't need a continuing resolution because that just hampers their ability to move assets around to meet one challenge that is greater than another. Hopefully, we will not have the kind of flood events we had last summer. Hopefully, we won't.

We are doing some smart messaging campaigns down in those three Central American countries, and with the cooperation of the governments, we are saying: Look, this is really what you are going to find when you try to come through Mexico and this Texas border. This is what the real truth is, and this is what you are going to run into when you get into the United States. It is the kind of truth campaign we are delivering with the help of those governments to try to reduce the attraction for coming.

But I came away more hopeful than maybe I was when I went down. There is reason for hope, but there is plenty to do—plenty to do.

If we can somehow put our political differences aside, I hope we will continue to fund the Department of Homeland Security so they can do their jobs. There are a lot of good people working for us around the world, and we don't need to hamper them further.

Finally, let's work on immigration. Let's roll up our sleeves and do this year a better job than what we tried to do 2 years ago—a better job. The American people sent us here to do that.

With that, I conclude my remarks. I thank you for your patience and attention.

I saw one of my colleagues walk on the floor. He is a Senator from another small but mighty State, the State of Rhode Island, and I am happy to yield for Senator Whitehouse to make whatever remarks he wishes to make.

The PRESIDING OFFICER. The Senator from Rhode Island.

CLIMATE CHANGE

Mr. WHITEHOUSE. Madam President, I might point out that not only are Delaware and Rhode Island both small and mighty, but they are small, mighty, and coastal, which is relative to the topic of my remarks this afternoon. I am now here for the 89th consecutive week that Congress has been in session to urge the Senate to wake up to the risks of climate change and to address the carbon pollution that is causing climate change.

We have a particular context for this conversation this week. The Founding Fathers in article I, section 8 of the Constitution granted to Congress a sacred duty, as the Constitution says, to

"provide for the common defense and general welfare of the United States."

To that end, we have built the world's greatest military and the most sophisticated intelligence and national security services. After the attacks of September 11, 2001, we undertook the largest reorganization of the Federal Government in half a century to stand up the Department of Homeland Security. We trust these national security agencies and the dedicated professionals who lead them and serve in them to ascertain and prepare for the risks facing our country in an uncertain world. But the tea party wing of the Republican caucus has chosen to hold up appropriations for vital Homeland Security programs—programs that protect Americans from terrorism, programs that help our States prepare for disasters—all to have a quarrel with the President on immigration.

Well, when we get to immigration—if our friends on the House side ever get to immigration—we could certainly debate the merits of the President's action. Certainly, we should pass legislation to fix our broken immigration system so the President's Executive actions are no longer necessary. And, by the way, in the Senate we did our job and passed a strong bipartisan bill. But to deny the Department of Homeland Security the resources it needs to safeguard the Nation is foolhardy.

Now, it is precisely because of that duty to safeguard the Nation that we should take our homeland security and military professionals seriously when they take seriously the threats posed by climate change. I think we should have a vote on a resolution highlighting the fact findings of our national security, military, and intelligence services about the climate threat. This resolution would express the sense of the Senate that the conclusions of our security professionals are not products of some hoax or deception perpetrated on the American public and that they deserve our respect.

That ought to be something every Senator can get behind. Let's look at some of the information. Just last week the administration's 2015 National Security Strategy classified climate change as "an urgent and growing threat to our national security." It is because this is serious that the United States is out there actively cutting pollution and strengthening resilience at home and leading the international community towards stronger carbon pollution standards.

The challenge that climate change poses to national security and to emergency preparedness is clearly laid out in the Department of Homeland Security's 2014 Quadrennial Homeland Security Review. It describes the effects of climate change as threat multipliers, with the potential to aggravate hazards to American safety and health. For example, higher temperatures may change patterns of disease and the spread of pests and pathogens.

Competition for resources can contribute to the kind of social destabilization that engenders terrorist activity all around the world.

You don't have to look far to see that today. Extreme weather and temperatures endanger the infrastructure that underpins our economy and way of life—from roads and bridges that now run too close to rising seas, to power and water treatment plants, to telecommunications and cyber networks.

As Assistant Secretary David Heyman of the DHS Office of Policy and Assistant Secretary Caitlin Durkovich of the Office of Infrastructure Protection explained to our own Senate Committee on Homeland Security and Governmental Affairs just last year:

The projected impacts of climate change, including sea level rise and increasing severity and frequency of extreme weather events, can cause damage or disruptions that result in cascading effects across our communities, with immeasurable costs in lives lost and billions of dollars in property damage.

Why would we not want to take that seriously?

We heard just the same message in the Budget Committee just last week from OMB Director Shaun Donovan.

Already, the annual number of costly weather-related disasters is going up. According to NOAA, in the 1980s—in that decade—if you look at the number of natural disasters costing \$1 billion or more, in each year of the 1980s there were between zero and five. That was the range for the 1980s—between zero and five \$1 billion weather events. In the 1990s that rate rose to between three and nine events each year. Then in 2000 it went up to between 2 and 11 events per year. Since 2010, in the category of \$1 billion disasters each year, the range has been between 6 and 16.

So from the 1980s, it was 0 to 5, until this decade when it is 6 to 16. If people can't take that seriously, they are simply not meeting their responsibilities.

Superstorm Sandy caused tens of billions of dollars in damage, including terrible losses in my home State of Rhode Island. Across New England, Sandy destroyed thousands of homes, left millions without electric service, and caused more than 100 deaths across nine States. Of course, we cannot say this one devastating storm was specifically caused by climate change, but we do know that carbon pollution loads the dice for more and more severe extreme weather such as Sandy.

Sandy sure showed how vulnerable we are to this kind of catastrophic change. Climate change presents security challenges in every corner of the homeland. To the south, DHS predicts that more severe droughts and storms could increase both legal and illegal movements across the U.S. border—from Mexico, from Central America, and from the Caribbean.

My Republican colleagues insist that protecting our border is a top priority—fine. I hope that means they will take seriously the warnings from our national security professionals about the destabilizing effects of climate change and its effects, in turn, on our border.

If you move up north to the State of Maine, our former colleague, Olympia Snowe, has just written an article in Newsweek magazine. I will read the opening:

In late 2014, fishery regulators announced that for the second consecutive year there would be no shrimp fishery in the gulf of Maine this winter. The culprit: principally warming ocean waters caused by climate change.

She goes on to describe another phenomenon that scientists dubbed an ocean heat wave in the spring of 2012 that led to an early molt and migration of lobsters that caused a supply glut and subsequent price collapse. Now if you know anything about Maine, you know lobsters are pretty important to Maine. Senator Snowe's conclusion: "The message here is clear: climate change is taking dollars and jobs away from fishing communities."

Mr. President, I ask unanimous consent that her article be printed at the conclusion of my remarks.

To the far north, melting sea ice opens the Arctic for shipping, tourism, and resource extraction, but also for smuggling and illicit resource extraction and environmental disasters. It is a whole new frontier to be patrolled and protected by our Coast Guard, part of the Department of Homeland Security, at taxpayer expense.

Former Coast Guard Commandant ADM Robert Papp, Jr., is now the U.S. Special Representative to the Arctic Region. He has got the job to help manage risk in this remote but increasingly accessible region in the world, and he had this to say about managing the consequences of climate change. Admiral Papp said:

I am not a scientist. I can read what scientists say, but I am in the world of consequence management. My first turn in Alaska was 39 years ago, and during the summertime we had to break ice to get up to the Bering Strait and to get to Kotzebue. Thirty-five years later, going up there as commandant, we flew into Kotzebue at the same time of year. I could not see ice anywhere. So it is clear to me that there are changes happening, but I have to deal with the consequences of that.

The men and women of our homeland and national security forces deal in real-world consequences. They don't have the luxury of skirting the evidence or shrugging off serious adult risk analysis.

It is just as true at the Department of Defense as it is at the Department of Homeland Security. As ADM Samuel J. Locklear, III, the Navy Commander of the U.S. Pacific Command, puts it, it is "... not my venue to debate the politics of any issue. All I do is report what I see and what I think I see, and the implications."

Admiral Locklear, our chief naval officer in the Pacific Command, has called climate change the biggest long-term security threat in the Pacific, because as he sees it, "it is probably the

most likely thing that is going to happen that will cripple the security environment."

Our colleagues may think it is funny to ignore climate change in this body while they depend so heavily on funding from the fossil fuel that is behind the pollution. They should listen to admirals who are responsible for our security when they tell us it is probably the most likely thing that is going to happen to cripple the security environment.

Last May, the CNA Corporation released a report on the risks climate change poses to our national security. This report was led by 15 generals and admirals from all 4 branches of the United States military. Here is what they said:

The national security risks of projected climate change are as serious as any challenges we have faced.

That is what they wrote. They continued:

We are dismayed that discussions of climate change have become so polarizing and have receded from the arena of informed public disclosure and debate. . . . Time and tide wait for no man.

Our military intelligence and homeland security services have been warning Congress for far too long about the risks of climate change. It is a dereliction of duty for this body to continue to ignore this problem. It is time to heed the warning. It is time to responsibly prepare for the clear risk before us, and it is time to wake up.

I yield the floor. I see the majority leader is present on the floor.

There being no objection, the material was ordered to be printed in the RECORD, as follows:

[From Newsweek, Feb. 9, 2015] LACK OF ACTION ON CLIMATE CHANGE IS COSTING FISHING JOBS

(By Senator Olympia Snowe)

In late 2014, fishery regulators announced that for the second consecutive year, there would be no shrimp fishery in the Gulf of Maine this winter. The culprit? Principally, warming ocean waters caused by global climate change.

Maine in particular is feeling this climate pinch: The water temperature in the Gulf of Maine increased eight times faster than the rest of the world's oceans in recent years, according to a 2014 study by Andrew Pershing, chief scientific officer at the Gulf of Maine Research Institute.

As a result, while the shrimp fishery is the first to close in New England primarily as a result of our changing climate, it is unlikely to be the last. Some of the Gulf of Maine's depleted stocks of groundfish, particularly Gulf of Maine cod, have been slow to rebuild from overfishing in the 1980s and 1990s in part as a result of warming water. Lobster has been disappearing from its traditional habitat in southern New England.

Meanwhile, the iconic lobster industry in Maine has experienced record landings in recent years, but more and more of the catch is coming from areas further down the coast toward Canada. And a phenomenon that scientists dubbed an "ocean heat wave" in the spring of 2012 led to an early molt and migration of lobsters that caused a supply glut and subsequent price collapse.

The message here is clear: climate change is taking dollars and jobs away from New England's fishing communities.

Scientists, fishery managers and industry members recognize the necessity of better understanding this phenomenon, and numerous research projects are already underway. For example, the National Oceanic and Atmospheric Administration and Rutgers University have partnered to analyze data from oceanographic and fisheries-dependent studies. Their project, OceanAdapt, has confirmed that fish species off the northeast United States are collectively moving to higher latitudes and deeper water in search of the cooler temperatures they require to survive.

Of course, fishermen are the ones who know their ocean the best. So in order to get their perspective on what they are experiencing on the water, the Center for American Progress (CAP) commissioned a poll of participants in the groundfishery as well as the lobster fisheries in Maine and Massachusetts.

The CAP poll shows that majorities of all these fishermen and women believe climate change poses a significant risk to their industry, as warming waters lead to lower profits and lower catch limits. Respondents are deeply concerned these impacts could force them from the fishery or result in the disappearance of traditional markets for their product.

This perspective is consistent with the findings of the "Risky Business" report released last June by a bipartisan committee co-chaired by Michael Bloomberg, Hank Paulson and Tom Steyer. I was involved as a member of this project's "Risk Committee," which found that the American economy faces significant and diverse economic threats from the effects of climate change—rising seas, increased damage from storm surge, and more frequent bouts of extreme heat—all of which will have measurable impacts on our nation.

Each geographic region analyzed by the project faces distinct and significant economic risks. Here in the northeast, projections are already showing that temperature increases in Gulf of Maine waters will restrict habitat for commercially vital species such as cod and lobster. In addition, sea levels are likely to rise by two to four feet in Boston by the end of the century threatening to swamp coastal infrastructure, including the wharves and fish houses critical to sustaining our fishing industry.

These numbers fail to reflect the potential for dramatic "storm surge" events, in which higher sea levels combine with more intense weather activity to increase flooding and storm damage. The Risky Business research finds that these kinds of impacts, combined, could increase annual property losses along the northeast coast from \$11 billion to \$22 billion—a two- to four-fold increase from current levels.

As vigorous policy debates continue in Washington, the economic impact of addressing climate change and transitioning to a lower carbon economy is understandably a key issue—and one that is not the domain of one side versus the other. Here in New England's fishing communities, there is serious and legitimate concern for the fishing jobs that will be lost if we don't act to rein in the emissions warming and acidifying our waters and causing sea levels to rise.

The loss of Maine's \$5 million shrimp fishery should serve as a warning. A similar blow to our \$300 million lobster fishery must be avoided at all costs. That will require honest, fact-based discussion and a genuine bipartisan commitment to solutions.

ADDITIONAL STATEMENTS

TRIBUTE TO DR. ROBERT LASKOWSKI

• Mr. CARPER. Mr. President, it is with great pleasure that I speak on behalf of the Delaware Delegation to honor the exemplary service of the president and CEO of Christiana Health Care System, Dr. Robert "Boh Laskowski. He served in this position since 2003, and during that time he transformed the largest not-for-profit health care system in Delaware into an award-winning hospital organization with a national reputation of patient quality and innovation. Bob is now retiring after more than two decades of serving Christiana Care. He is a tremendous leader and true advocate for the patient and health-care worker, as well as a devoted husband to his wife. Kathy, and loving father to their children and grandchildren. His hard work. leadership and willingness to work together on transforming the health care system in Delaware and the Nation will truly be missed.

Bob used his leadership role at Christiana to cultivate philanthropic endeavors in the community. He lives "The Christiana Care Way" of serving our neighbors as respectful, expert, caring partners in their health. Under his leadership, Christiana Care has given back millions of dollars to the Delaware community.

Bob is a graduate of the University of Pennsylvania School of Medicine with a master's degree in business administration from the University of Pennsylvania's Wharton School of Business. He is a board-certified internist specializing in geriatric medicine who understands the needs and priorities of health care professionals, as well as the business of running a health care system

Bob's reach extends far beyond Delaware's borders. He is nationally recognized for his work on health care transformation. He fearlessly took on the challenge of making Christiana Care Health System a model for other hospital systems around the country. Bob's notable accomplishments include expanding the Helen F. Graham Cancer Center & Research Institute to a 200,000-square-foot state-of-the-art facility that serves the majority of cancer patients in Delaware. This National Cancer Institute selected Community Cancer Center is a national model for care and a leader in enrolling patients in clinical trials. He also led Christiana Care in earning recognition by the American College of Surgeons National Surgical Quality Improvement Program as 1 of only 37 hospitals in the Nation achieving "meritorious" outcomes for surgical patient care in 9 clinical areas. His expertise is sought out throughout the country as he serves on the board of directors of the Association of American Medical Colleges and on its finance and executive compensation committees. He serves
